

RIVERBEND INTERNAL MEDICINE - AFTER VISIT SUMMARY

Fictional sample for AfterVisit demos. Not a real patient.

Patient: Margaret W. Visit date: 10/03/2026 Provider: Anita Patel, MD (Internal Medicine)

Reason for visit: Follow-up, hypertension; new complaint of dizziness when standing.

Assessment: Blood pressure remains above goal (158/92 today). Lightheadedness on standing likely related to meclizine and dehydration; no signs of inner-ear cause today.

Medication changes:

- INCREASE lisinopril to 20 mg once daily in the morning (was 10 mg).
- STOP meclizine 25 mg. Do not take unless instructed.
- CONTINUE atorvastatin 40 mg nightly.

Check blood pressure at home every morning before medications and write it down. Bring the log to the next visit.

Orders / referrals:

- Physical therapy referral for balance and fall prevention. Please call to schedule within 2 weeks.
- Lab: basic metabolic panel in 2 weeks to check kidney function and potassium after the dose change.
- Return visit in 6 weeks with Dr. Patel.

Call the clinic if: dizziness gets worse, any fall, swelling of the lips or face, or home blood pressure readings below 100/60 or above 180/110.

Discuss at next visit: whether to start a vitamin D supplement; sleep concerns raised by daughter.

Drink at least 6 glasses of water daily unless told otherwise.
